

Clustering ring near the unit circle.
Degrees 3-8 (blue, magenta, olive, grey, white) mix to lavender.
From the separate degree plots, this halo is mainly degrees 5, 6, 7, 8 and 9.

Root of $z^2 + 1 = 0$ (degree 2).
Almost every other degree piles up here too:
any polynomial with a factor $(z^2 + 1)$
has these two roots for certain.

$z = e^{i\pi/3} = \frac{1 + i\sqrt{3}}{2}$

Cyan in the hue table. The six conjugate roots of one degree-6 family sit close together as a six-fold flower.

Degree 1 is red in the hue table.
Roots pile up on this integer and
clip the colour to white/gold.

Every degree contributes roots at $z = 0$ (set the constant term to zero) — so all nine hues pile up here, additively mixing toward white, with gold where the lower degrees still dominate in brightness.
