

**E Violet halo**  
Overlapping degrees 3–8 (blue, magenta, olive, grey, white) at low brightness, additive blending averages them to lavender.

**C  $z \approx i$  (quadratic)**  
Root of  $z^2 + 1 = 0$  (degree 2) → green.

**D Degree-6 rosette**  
Cyan in the hue table. The six conjugate roots of one degree-6 family land close together, drawing a six-fold flower.

**B'  $z \approx -1$  (rational)**  
Mirror of  $z \approx +1$  across the origin. Same degree-1 pile-up on a rational integer, brightness clips past red into white/gold.

**B  $z \approx +1$  (rational)**  
Degree 1 → red in the hue table, but so many roots pile up on an integer that brightness clips past red into white/gold.

**A Origin ( $z = 0$ )**  
Thousands of degree-1 (rational) roots coincide here, the overlap saturates every colour channel to white / gold.

**C'  $z \approx -i$  (quadratic)**  
Mirror of  $z \approx i$  across the origin. Root of  $z^2 + 1 = 0$  (degree 2) → green.

- meaning of colors**
